

THE  
the **Giorgio**  
Foundation

*no child should fear their future*

Giorgio Borzellino seemed like a perfectly healthy baby at first, but his parents started to sense that something was off when he began missing significant childhood milestones. Doctors first suspected autism, but when Giorgio was five years old, a neurologist correctly diagnosed **neurofibromatosis type 1 (NF1)**.

NF1 occurs in about **1 in every 3,000** births. While some with NF1 can lead full lives, many suffer disfiguring and disabling complications including tumors, learning difficulties, and bone deformities.

Sadly, no surgery or treatment can stop it. With the hope of achieving scientific breakthroughs that will improve lives, Giorgio's family established **The Giorgio Children's Foundation, which directly funds researchers focused on NF1.**

The dream for me?  
**TUMOR FREE**

## What is NF1?

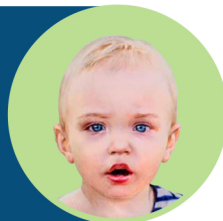

**Neurofibromatosis type 1 (NF1)** is a genetic condition impacting the chromosome that produces a protein which prevents cells from growing too quickly. It affects all populations equally, regardless of gender, race, or ethnicity. Symptoms appear over time, with the most common being six or more small, flat, brown spots that appear on the skin in early childhood. Throughout adolescence and adulthood, the missing protein may cause painful skin tumors to grow and become debilitating.

### Other manifestations of NF1 include:

- Learning difficulties
- Fragility or curving of leg bones
- Scoliosis
- Benign spots on the eyes

Not all NF1 sufferers experience the same complications. The uncertainty of what lies ahead with this disease is scary.

## What does it LOOK LIKE?

Early Childhood

"I wake up with a bump on my face and pray it's a pimple, not the start of a tumor."

JOHN,  
TEENAGER WITH NF1

Adolescence

Adulthood

## How to Give:

ENDNF1.ORG

118 MCDONALD DR.  
DUNCANVILLE, PA 16635

**MD, PhD**  
Director of Washington  
University NF Center  
Washington University

**Lu Le**  
**MD, PhD**  
Professor of Dermatology/  
Principal Investigator  
in Cancer Biology  
University of Texas, Southwestern

**Sameer Agnihotri**  
**PhD**  
Director of Brain Tumor  
and Therapy Lab  
University of Pittsburgh Medical Center

**Corina Anastasaki**  
**PhD**  
Assistant Professor,  
Neurology  
Washington University

You are **MAKING AN IMPACT**

Over \$3M of  
medical research  
funding since 2016

Research focused on  
gene repair and  
treatment for skin tumors

15 groundbreaking  
research studies  
at major universities

Discovered cell origin of  
NF and developed antibody  
to detect NF protein

Giorgio & Ben

## The dream for me? **TUMOR FREE**

For Giorgio, one of the scariest things about the disease is the painful tumors that may develop over time. **His dream is to be tumor free.**

Giorgio's grandfather, Ben Stapelfeld, helped establish The Giorgio Foundation. **His dream for his grandson and others with NF1 is to lead full and rewarding lives.**
